## INTRODUCTION

The data used in this note are hourly observations taken at Cape Collinson between January 1968 and December 1973. A total of 52,608 observations on punched cards were processed on the Observatory's IBM 1130 computer. Observations taken during the years 1964-1967 are not included in the present analysis, as different codes were in use. However, according to W.M.O., analyses based on observational data covering a period of 6 years are considered adequate for climatological purposes.

Programs were developed to print out monthly tables for various meteorological elements while quality control and validation of data were carried out manually.

## HISTORY OF THE STATION

The establishment of the Cape Collinson Aeronautical Meteorological Station was first suggested by the Director of Civil Aviation in February, 1959. In his correspondence with the Director of Royal Observatory, he pointed out that with the new runway, the critical point for aircraft taking off on the 134° heading was no longer over Waglan Island, 16 km from the threshold, but in the area between Lei Yue Mun and Tathong Point, 6 km from the threshold to runway 31. Furthermore, after the installation of I.L.S. (Instrumental Landing System) and P.A.R. (Precision Approach Radar), reports from the area would be of great value for instrumental approaches on Runway 31, giving an estimate of slope visibility from the area in which the aircraft might be expected to break through the clouds. Such reports would also be of value to aircraft making visual approaches from Lei Yue Mun using the contemporary navigational aids.

A suitable site for such an observing station was found on Cape Collinson, being both easily accessible and having a view of the end of the runway, Lei Yue Mun, Tathong Point and Waglan Island. In 1960, it was decided that a new meteorological station at Cape Collinson should be established on the site of the existing lighthouse. It was also proposed that the meteorological station at Waglan Island would be handed over to the Director of Marine Department and his staff would continue to make weather observations every 3 hours or every half-hour on request. This scheme was approved in September 1961 and the building work eventually commenced on 1st January 1963. The project was completed in November 1963 at a cost of about HK\$146,000. On New Year's Day, 1964, exactly one year after commencement of construction, Cape Collinson Station became operational. The number '45008' was allocated to the new station and it was included in the ICAO regional plan.

Scientific Assistants were on duty 24 hours daily and half-hourly observations were made and passed to the Airport for inclusion in the VOLMET broadcast. Voice communication between Cape Collinson, the Airport and the Royal Observatory was maintained by VHF radio-telephone transceiver sets on a frequency of 72.3 MHz. The staff were also responsible for the operation of the marine light at the lighthouse.

No major changes were made in the instrumentation or operation of the station for ten years. In January, 1974, the Civil Aviation Department commissioned a new Instrument Guidance System and the value of the meteorological observations from Cape Collinson was greatly reduced. Whilst the meteorological reports still retained some value for forecasting purposes, the expenditure incurred for 24-hour operations at Cape Collinson could no longer be justified. The Royal Observatory therefore closed the station and the last observation made was at 0000 GMT on 18th July, 1974.

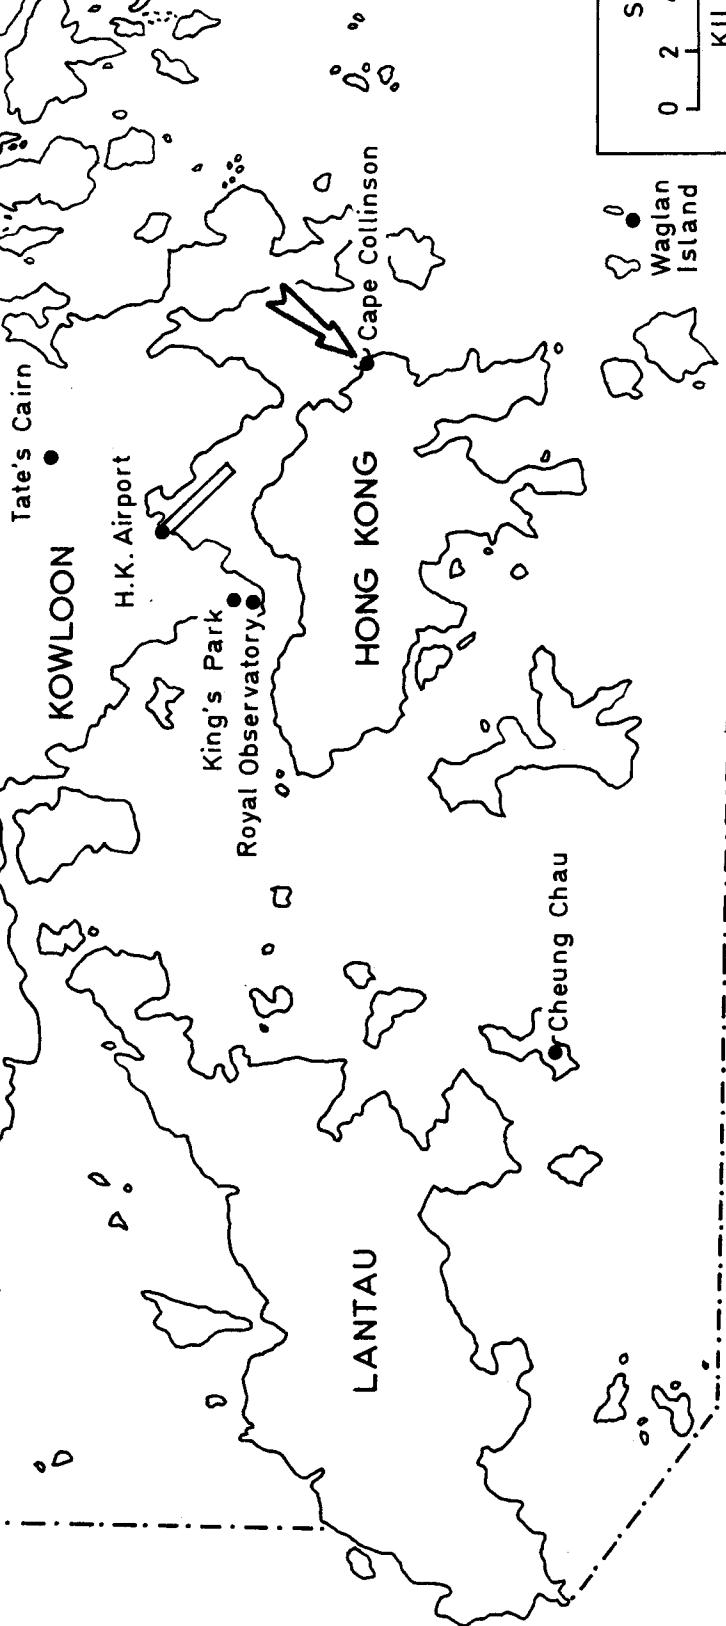

STATION PARTICULARS FOR CAPE COLLINSON AERONAUTICAL METEOROLOGICAL STATION:

LATITUDE:  $22^{\circ} 15' 47.3''$  N

LONGITUDE:  $114^{\circ} 15' 16.2''$  E

ELEVATION: 46 METRES ABOVE M.S.L.

MAP REFERENCE: KV 171646

## INSTRUMENTS AND METHODS OF MEASUREMENT

### 1. ATMOSPHERIC PRESSURE

The barometer used was a Kew pattern No. 3390/46/48/50 manufactured by F. Darton and Company Limited. Correction for index error, adjustment of the readings to the standard temperature of 0°C and the standard gravity of 9.80665 m/s<sup>2</sup>, and reduction to mean sea-level were carried out using the methods described in the 'Guide to Meteorological Instruments and Observing Practices' published by the World Meteorological Organisation, WMO - No. 8 TP 3.

Height of cistern above floor = 0.78 m

Height of cistern above mean sea-level = 47.67 m

Height of floor above mean sea-level = 46.90 m

A Casella barograph (No. 931) kept a continuous record of the mean sea-level pressure and this was used to check the accuracy of the hourly readings.

### 2. AIR TEMPERATURE, DEW POINT AND RELATIVE HUMIDITY

The thermometers were placed in a Stevenson Screen with their bulbs about 1.25 metres above ground level. Values of dew point temperatures and relative humidity were calculated from the dry- and wet-bulb readings, using a Meteorological Office Mark 6 humidity slide rule.

The maximum and minimum thermometers were similarly exposed, both being read twice daily at 0800 hours and midnight.

A Negretti and Zambra mercury-in-steel distant recording thermograph (T/510191) was installed on 26th June, 1964 and kept a continuous record of the dry and wet-bulb temperatures. This was used to check the accuracy of the hourly readings.

### 3. WIND

Winds were measured by a Dines pressure-tube anemograph incorporating a twin-pen direction recorder, manufactured by R.W. Munro Limited. The head was 10.06 metres above the roof of the building (59.4 metres above mean sea-level). The wind at the station is affected by the nearby steep hills, as can be deduced from the photograph of the site on page 5. The station appeared to have been over-exposed to northerly winds but sheltered from easterlies and southeasterlies.

### 4. RAINFALL

Daily rainfall had been recorded since September, 1953 with an ordinary 5" standard raingauge by the lighthouse keepers. Readings of hourly rainfall were taken after the station became operational on 1st January, 1964. At the same time, a 5" natural siphon raingauge was installed. On 13th February, 1970, the natural siphon raingauge was replaced by a 5" Dines Tilting Siphon raingauge.

### 5. CLOUD

Visual observations of cloud type and amount, and estimates of the height of the cloud base were made with reference to well-marked topographical features.

At night, the height of the cloud base was measured by means of a cloud searchlight whenever cloud was present below the limits of penetration of the beam. The alidade was fixed on a post outside the observing room. The cloud searchlight was set up at a distance of 258.6 metres away from the alidade.

Height of cloud searchlight above mean sea-level	= 52.9 m
Height of Alidade above mean sea-level	= 48.4 m
Height of Alidade above station level	= 1.5 m

### 6. VISIBILITY

Eye estimates of horizontal visibility were made with reference to well-marked topographical features.

## EXPLANATION OF TABLES, DIAGRAMS AND GRAPHS

### 1. MONTHLY AND ANNUAL WIND ROSES

The total number of occurrences of concurrent wind speed and direction is computed for each month. Wind directions are grouped into ranges of  $30^{\circ}$  and wind speeds in knots into categories as follows : 1-6, 7-16, 17-27,  $\geq 28$ . The percentage frequencies are plotted in the form of wind roses.

### 2. DIURNAL VARIATION OF WIND

Hourly vector mean winds are computed for each month. These are plotted onto vector diagrams. The monthly resultant wind is shown by an asterisk.

### 3. MEAN NUMBER OF SIMULTANEOUS OCCURRENCES OF SPECIFIED VISIBILITY RANGES AND SPECIFIED RANGES OF THE HEIGHT OF THE BASE OF THE LOWEST CLOUD LAYER COVERING 5 OKTAS OR MORE OF THE SKY

This analysis is made to conform with Model A of the Climatological Summary in WMO Technical Regulations - Volume I, No. 49, 1971 Edition. A similar analysis is made for occasions when the lowest cloud layer covered 1 okta or more of the sky.

Monthly tables are given on pages 36 to 47.

Ranges for the height of the base of cloud are given in hundreds of feet, and are to be interpreted as follows : height of base of cloud equal to or greater than ..... (lower limit) but less than ..... (upper limit).

'OBSC' in the table means that the sky is obscured and the height of the base of cloud is not observed.

Ranges for the visibility are given in kilometres and are to be interpreted as follows : visibility equal to or greater than ..... (lower limit) but less than ..... (upper limit).

An entry in the table gives the mean number of occurrences in the specified category during the period of record. The entry is  $nK/s$ , where  $n$  = total number of observed occurrences in the category,  $K$  = number of days in the month and  $s$  = total number of observations available. An entry "\*" indicates that the mean number is greater than zero but less than 0.05.

#### 4. CLIMATOLOGICAL SUMMARY

This table was prepared according to paragraph 12.2 of Chapter 12 in 'Guide to Climatological Practices' - WMO - No. 100 TP 44.

#### 5. TABLES OF HOURLY MEANS OF METEOROLOGICAL ELEMENTS

Hourly means in each month for the following elements are tabulated on pages 50 to 55.

- (a) mean sea-level pressure
- (b) air temperature
- (c) wet-bulb temperature
- (d) dew point
- (e) relative humidity
- (f) cloud amount

#### 6. GRAPHS SHOWING THE DIURNAL VARIATION OF METEOROLOGICAL ELEMENTS

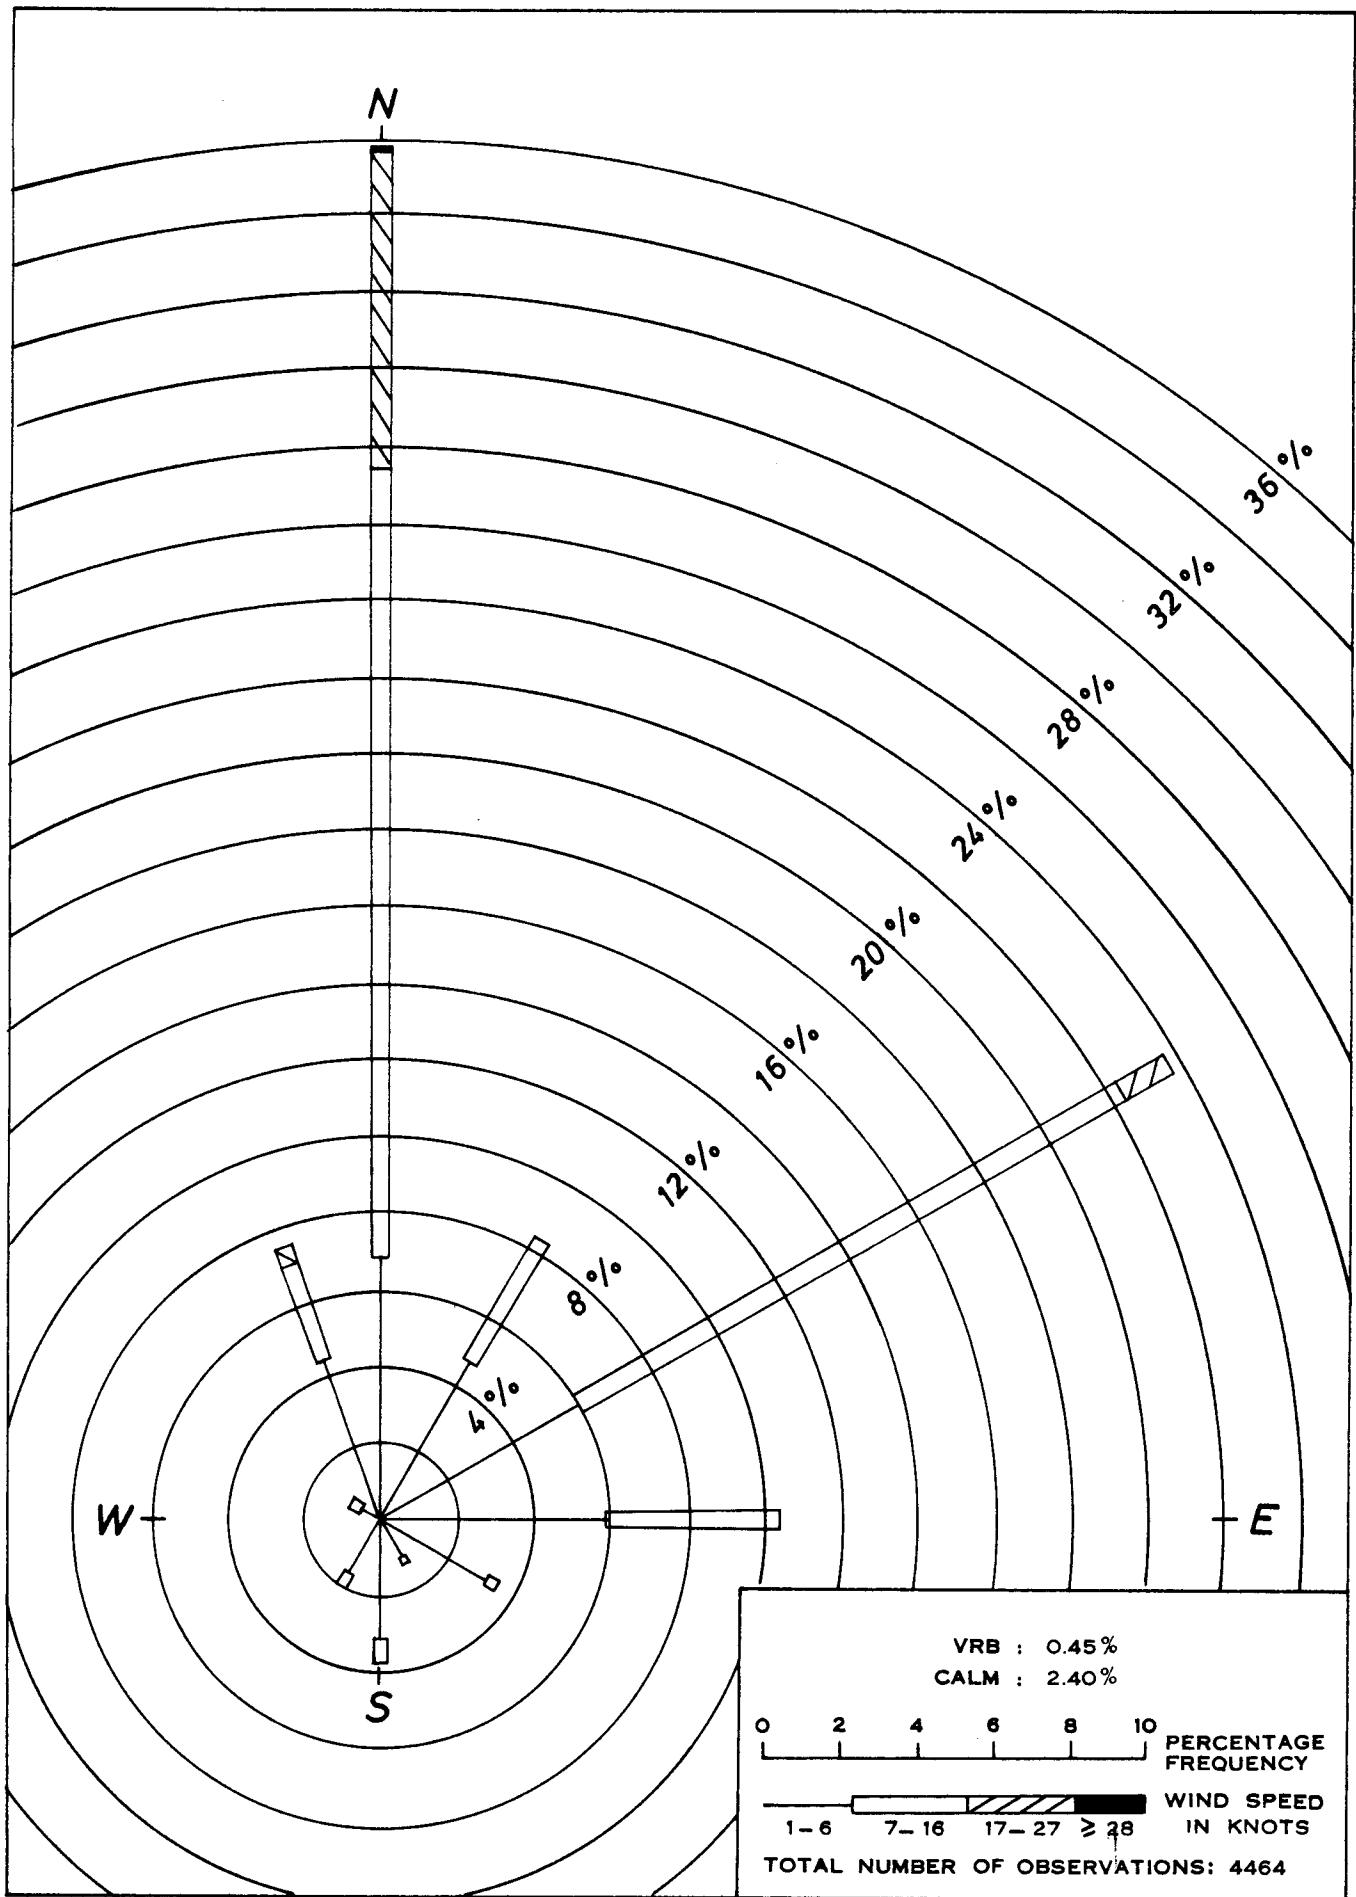

These graphs are plotted using the figures in (5) above. Monthly graphs for the following elements are shown on pages 56 to 60.

- (a) mean sea-level pressure
- (b) air temperature
- (c) wet-bulb temperature
- (d) relative humidity
- (e) cloud amount
