## 摘要

本報告是大埔滘自動氣象站在 1991 - 1998 期間的氣候摘要。除列出標準氣候圖表外，亦將大埔滘的紀錄與橫瀾島的風紀錄及天文台的氣溫紀錄作出比較。

## Abstract

This note gives a climatological summary for Tai Po Kau Automatic Weather Station during 1991-1998. In addition to standard climatological tables and diagrams, comparisons of wind with Waglan Island and temperature with Hong Kong Observatory are also made.

## 1. INTRODUCTION

Automatic weather stations were set up in Hong Kong to meet increasing demands for regional meteorological data for engineering projects in areas under development and to improve weather services. There are 27 such stations in operation at present. Tai Po Kau Automatic Weather Station, closed now, was operating for more than 8 years. This note is to give a climatological summary for this station.

## 2. HISTORY OF THE STATION

Tai Po Kau Automatic Weather Station ( $22^{\circ}26'35''$  N ,  $114^{\circ}10'50''$  E) was in operation between 22 August 1990 and 17 December 1998. It was located at Tai Po Kau Base of Marine Police as shown in [Figures 1](#) and [2](#). The station was sheltered to the north, south and southwest by hills and most exposed to the east and southeast. There is also a channel between Tai Mo Shan and Tai To Yan to the west of the station.

The high hills around the station are :

Tai Mo Shan	(957 m)	7 km to WSW
Grassy Hill	(647 m)	4 km to SSW
Pat Sin Leng	(511 m)	7 km to NE
Wong Leng	(639 m)	6 km to NNE
Kau Lung Hang Shan	(440 m)	4 km to NNW
Tai To Yan	(565 m)	7 km to W

## 3. DATA

The data used in this note are hourly records measured at Tai Po Kau Weather Station between January 1991 and December 1998. A total of 67703 observations was loaded into the Oracle database of the Hong Kong Observatory and analyzed using SQL (Structured Query Language). It should be noted that there are periods of incomplete data due to equipment or transmission failure.

#### **4. INSTRUMENTS AND METHODS OF OBSERVATION**

At automatic weather stations, measurements of dry-bulb and wet-bulb temperatures, dew point, relative humidity and wind are recorded by automatic instruments and data are transmitted to the Hong Kong Observatory at one-minute intervals via telephone circuits. [Figures 3\(a\)](#) and [\(b\)](#) show the instruments at Tai Po Kau. The following paragraphs describe the instruments and methods of observation used during the years 1991-1998.

(a) Air temperature, dew point and relative humidity

A Stevenson screen box was installed on the grassland near the entrance of the Marine Police Station. Dry-bulb and wet-bulb temperatures were measured by platinum resistance thermometers with its sensing elements placed in the screen box. The elevation of the thermometers was 5.4 m above mean sea level.

Values of dew-point temperature and relative humidity were calculated from the dry-bulb and wet-bulb temperatures. However, the measurement of wet-bulb temperature ceased after June 1995.

Daily maximum and minimum temperatures were extracted from 1-minute data in each day.

(b) Wind

Winds were measured with a Teledyne Geotech WS201 cup anemometer on the roof of the Police Station with its head 27.6 m above mean sea-level. Hourly mean wind was computed from the 1-minute data in the hour (Yeung et al 1987).

## 5. ANALYSIS

(a) Climatological Summary

Monthly values of meteorological elements are summarized in [Table 1](#). Readers are reminded that data are subject to loss because of equipment or transmission failure.

(b) Monthly and annual wind roses

The total number of occurrences of concurrent wind speed and direction is computed for each month. Wind directions are grouped into ranges of  $30^\circ$  and wind speeds in m/s into categories as follows : 0.1-3.2, 3.3-8.2, 8.3-14.2 and  $>14.2$ . The percentage frequencies are shown in [Table 2](#) and are plotted in the form of wind roses in [Figures 4-6](#).

It can be seen that the most frequent and prevailing wind direction is easterly. It is worth noticing that a considerable proportion of wind comes from the west, probably due to orographic effect.

(c) Diurnal variation of wind

Hourly vector mean winds are computed for each month. These are shown in [Table 3](#) and plotted in [Figures 7-8](#). A study of the sea-land breeze system in Hong Kong (Zhang and Zhang 1997) shows that sea breeze near Tai Po Kau generally blows from the east and land breeze from the northwest. Prevailing easterlies are thus enhanced in the afternoon and moderated during nighttime and morning throughout the year. In winter during October - January, the drop of wind speed during nighttime and morning is so significant that it becomes light and wind direction becomes variable.

(d) Hourly means of meteorological elements

Hourly means in each month for the following elements are shown in [Tables 4-7](#) and are plotted in [Figures 9-12](#).

- (i) air temperature
- (ii) wet-bulb temperature
- (iii) dew point
- (iv) relative humidity

(e) Gust factor

Gust factor is defined as the ratio of hourly instantaneous maximum gust to hourly mean wind. Using the regression equation of gust(G) on hourly mean wind(M), gust factor(GF) can be obtained.

If the regression equation is written as

$$G = a M + b$$

then  $GF = a + b/M$

Regression equations for winds in different quadrants and their corresponding gust factors are shown below :

$G = 1.40 M + 1.40$ , $r=0.91$	( direction between $050^\circ$ and $130^\circ$ , east )
$G = 1.97 M + 0.98$ , $r=0.83$	( direction between $140^\circ$ and $220^\circ$ , south )
$G = 1.55 M + 1.47$ , $r=0.87$	( direction between $230^\circ$ and $310^\circ$ , west )
$G = 1.59 M + 1.51$ , $r=0.89$	( direction between $320^\circ$ and $040^\circ$ , north )

where r is the correlation coefficient.

Hourly mean wind (m/s)	Gust factor			
	East	South	West	North
5	1.68	2.17	1.84	1.89
10	1.54	2.07	1.70	1.74
15	1.49	2.04	1.65	1.69
20	1.47	2.02	1.62	1.67

(f) Extreme values of temperature and gust

The top 20 extreme values of maximum and minimum temperatures, and maximum gust are listed in [Table 8](#). The extreme values recorded at the Hong Kong Observatory during the same period are also given on the last line for comparison.

Extreme maximum temperatures were due to subsidence ahead of tropical cyclones or prolonged fine weather brought about by ridges. Extreme minimum temperatures were due to cold surges in winter times.

The occurrences of maximum gusts were recorded during the passage of tropical cyclones. They were Brendan, Fred, Koryn, Tasha, Sibyl, Sally and Victor in July 1991, August 1991, June 1993, August 1993, October 1995, September 1996, and August 1997 respectively.

(g) Comparison of wind with Waglan Island

Differences in wind direction between Tai Po Kau (TPO) and Waglan Island (WGL), grouped by four quadrants (as in (e) above), are measured with the angle veering or backing from the prevailing wind direction recorded at Waglan Island. These differences are shown in [Figure 13](#). For the east, south and west quadrants, the distributions are almost single-peak and bell-shaped. Winds at Tai Po Kau most often veer 20 degrees from the easterlies at Waglan but back 30 degrees from the southerlies. There is no significant change in wind direction from prevailing westerlies. Two peaks are observed for the north quadrant, indicating that when winds at Waglan are northerlies, winds at Tai Po Kau would most often back 100 degrees and the second likely direction would veer 60 degrees from the northerlies.

Regression equations of hourly wind speeds at Tai Po Kau against those at Waglan Island in different quadrants with the speed at Waglan Island exceeding 5 m/s are shown below:

East	:	$V_{TPO} = 0.38 V_{WGL} - 0.02$	( $r = 0.55$ )
South	:	$V_{TPO} = 0.26 V_{WGL} - 0.04$	( $r = 0.46$ )
West	:	$V_{TPO} = 0.20 V_{WGL} + 0.50$	( $r = 0.34$ )
North	:	$V_{TPO} = 0.19 V_{WGL} + 1.23$	( $r = 0.35$ )

The linear relationships can only be regarded as fair, as reflected by the small values of correlation coefficients. The wind speed of Tai Po Kau is about 30 - 40% of that at Waglan Island with easterlies and northerlies and about 20 - 30 % from other directions.

(h) Comparison of temperature with Hong Kong Observatory

Regression equations of daily maximum, minimum and mean temperatures at Tai Po Kau against those at the Observatory (HKO) are shown below:

daily maximum temperature	:	$T_{TPO} = 1.03 T_{HKO} - 0.89$	( $r = 0.99$ )
daily minimum temperature	:	$T_{TPO} = 1.06 T_{HKO} - 2.35$	( $r = 0.99$ )
daily mean temperature	:	$T_{TPO} = 1.05 T_{HKO} - 1.67$	( $r = 0.99$ )

Excellent linear relationships can be seen in the scatter diagrams with associated regression lines shown in [Figures 14](#).

Generally, the daily maximum temperature and daily mean temperature are almost the same as those of the Observatory in summer. On the other hand, the daily minimum temperature is about 1.5°C lower and the daily mean temperature is about 1°C lower in winter at Tai Po Kau.

## **ACKNOWLEDGEMENT**

The authors would like to thank Mr. W.K. Kwan for his valuable comments on reviewing this note.
